**19COP502 Building Secure Networks
Lab Report**

Loughborough University

© BT NETWORK 2019

Nov. 2019

Abstract

This report describes the building process of BT Network, a small version of Tier-2 Internet Service Provider. To first define the architecture of the network, a network diagram is drawn, in which physical connections are established and IP addresses are assigned. Then, connectivity within the network and with outside networks are made possible through internal routing protocol Intermediate System to Intermediate System (IS-IS) and external Border Gateway Protocol (BGP). In addition, services such as World Wide Web (WWW), Domain Name System (DNS) and Email are provided in the network. At last, main conclusions and further improvements are discussed.

Chapter 1

Introduction

In this lab, our team sets out to build BT Network, a small version of Tier-2 Internet Service Provider (ISP) located at Haslegrave Building, from scratch. Despite its limitations in terms of size and Internet access, we can proudly attest that BT Network is one of the leading providers at Haslegrave Building.

BT network is an Autonomous System (AS) as a whole and the AS Number is 2030. Its domain name is `bt.lboro`.

1.1 Network Services

Our network provides the following services to each of our individual customers.

- IP addressing with a guaranteed range of 14 host addresses allocated from `23.0.0.0/8` (IPv4) and `2001:2300::/32` (IPv6) blocks.
- Intra-domain Internet connection with Intermediate System to Intermediate System (IS-IS) routing protocol.
- Inter-domain Internet connection with Border Gateway Protocol (BGP).
- A reliable Domain name System (DNS) service with duplicated servers under domain `bt.lboro`.
- A World Wide Web (WWW) service located at `http://bt.lboro/`.
- An Email service at `bt.lboro`.

For neighbouring ISPs who is a customer in our business relationships (see Section 1.2.3), we provide the following services.

- Internet connection to our domain as well as all the others’.

In addition, we provide secure remote access to our routers through Secure Shell (SSH) protocol on one of our laptops for administrative purposes.

1.2 Business Relationships with Neighbouring ISPs

BT Network has three immediate neighbouring ISPs and it’s important to form business relationships with all three of them in order to gain economic benefits. The external routing policies of BGP protocol for each outside network are determined by its business relationship with us (see Section 3.2 for details). Business relationships with neighbouring ISPs are shown in Figure 1.1 and elaborated in the following.

Figure 1.1: Business Relationships of BT Network with Neighbouring ISPs.

1.2.1 Provider: Central Network

Since BT Network is a Tier-2 ISP, it need to be connected to a Tier-1 ISP to gain broader Internet connection. Therefore, BT is connected to Central Network, a Tier-1 ISP, as a customer which makes it a network provider for BT.

1.2.2 Peer: Virgin Network

BT Network forms a Peer relationship with Virgin Network. This allows Virgin Network to connect to BT Network at zero cost and vice versa.

1.2.3 Customer: DT Network

BT Network forms a Provider-Customer relationship with DT Network, in which BT is the provider and DT is the customer. In other words, DT gains access to the broader Internet through BT at a cost.

1.3 Roles of Network Components

There are 6 physical components in our network in total, of which 3 are Cisco routers and the other 3 are TOSHIBA laptops. Each component plays an important role in the network as shown in Figure 1.2.

1.3.1 Routers

In terms of connection, each router is attached with one customer subnet and thus providing Internet service to one customer. Router 1 (BT-R001) is not physically connected to any outside network. Router 2 (BT-R002) is connected to DT Network and Router 3 (BT-R003) is connected to Virgin Network and Central Network through cables.

In terms of routing, all routers are Level-1 routers in intra-domain IS-IS routing protocol. In BGP routing protocol, Router 1 (BT-R001) acts as an Internal BGP (IBGP) router while Router 2 (BT-R002) and Router 3 (BT-R003) act as External BGP (EBGP) routers.

1.3.2 Laptops

All laptops are running a Ubuntu 16.04 system. Each of them is connected to a customer subnet through a cable. In terms of services, Laptop 1 (BT001) provides DNS service for `bt.lboro` as a secondary DNS server and WWW service at `http://bt.lboro`. It also acts as a secure SSH access point to routers for administrative purposes. Laptop 2 (BT002) doesn't provide any service and thus acts as a normal user in the network. Laptop 3 (BT003) provides DNS service for `bt.lboro` as a primary DNS server. In addition, it hosts Email service at `bt.lboro`.

Figure 1.2: Roles of Main Components in BT Network.

1.4 Organisation of the Report

The report is organised as follows. The architecture of BT Network on the network layer is described in Chapter 2. A Network Diagram involving all physical components and connections is drawn in the chapter. Then, IP addresses for interfaces in the network are carefully allocated and configured.

In order to allow packets to be forwarded within and outside the network, proper intra-domain and inter-domain routing protocols are implemented and tested in Chapter 3.

In Chapter 4, we move up to the application layer and set up various services in the

network as listed in Section 1.1.

Main conclusions drawn from the building process and possible further improvements are discussed in Chapter 5. At last, a summary of contributions for each team member is presented in Chapter 6.

Although the report does not necessarily reflect the actual order of steps in our building process (eg. remote SSH access was set up before BGP), readers can be assured that all results presented can be reproduced by following the natural order of the report.

To ensure readability, rationale behind important decisions made, problems we encountered and their respective solutions, alternative ways of configurations (if any) as well as reflective commentary are documented along with each step of implementation in the report.

Chapter 2

Network Architecture

2.1 Network Diagram

2.1.1 Description

A full diagram of BT network is shown in Figure 2.1. There are 3 routers in the network, whose names are BT-R001, BT-R002 and BT-R003 respectively, connected to each other. Each connection forms a Router-Router subnet with only 2 interfaces.

On the other hand, each router is connected with a laptop separately named as BT001, BT002 and BT003 and thus forms a Router-Laptop subnet. A customer of BT Network is assigned with a Router-Laptop subnet and has a minimum of 10 host IP addresses.

To connect to neighbouring ISPs, a Router-Neighbour subnet is formed for each connection. Concretely, Router 2 (BT-R002) is connected to one of DT Network's routers while Router 3 (BT-R003) is connected to one of Virgin Network's and Central Network's routers separately.

All of the above connections are through physical cables.

Figure 2.1: Full Network Diagram of BT Network.

2.1.2 IP Addresses and Interfaces

An IPv4 address range of 23.0.0.0/8 and IPv6 address range of 2001:2300::/32 are allocated to BT Network, which are further divided into sub-ranges to be allocated to each subnet.

For IPv4 addressing, a prefix of n is needed for a subnet that demands X host addresses, where n is an integer that satisfies $2^{32-n} - 2 \geq X$ and $n \leq 32$. For our lab, the maximum value for prefix is used in order to minimize the size of each subnet and reserve address space for future customers. **However, it's also possible to use a larger value for each Router-Laptop subnet in order to maximize the size of the subnet, given that the number of customers (in this case, 3) is fixed.**

In BT Network, the prefix for each Router-Router and Router-Neighbour subnet is 30 while the prefix for each Router-Laptop subnet is 28. In other words, each Router-Router and Router-Neighbour subnet has 2 guaranteed IPv4 host addresses while each Router-Laptop subnet has 14 guaranteed IPv4 host addresses. During address block allocation, larger subnet is being considered before smaller one reduce the number of block segments.

For IPv6 addressing, however, each subnet has a fixed prefix of 64 to ensure that each interface in the subnet has a unique address. The full details of IP address allocation is shown in Table 2.1.

Figure 2.2: Physical Connections within BT Network.

In terms of interfaces, there are 3 Ethernet interfaces (**FastEthernet0/0**, **FastEthernet0/1** and **FastEthernet0/1/0**) on Router 1, each of which can be assigned with an IP address. On Router 2 and 3, however, there are 6 Ethernet interfaces each and only 2 of them (**FastEthernet0/0** and **FastEthernet0/1**) can be directly assigned with IP addresses. The remaining 4 interfaces are link layer interfaces and thus does not possess any IP address. To be assigned with an IP address, such an interface need to be assigned to an Virtual LAN (VLAN) to which the address is actually assigned.

Router-Router connections are established through either **FastEthernet0/0** or **FastEthernet0/1** interfaces on both ends while Router-Laptop and Router-Neighbour are through one of the remaining interfaces on the router end. Since both interfaces are on the left-hand side of each router and such arrangement helps distinguishing between Router-Router connections and others easily as shown in Figure 2.2. Interfaces of both ends for each connection as well as their corresponding IP addresses are detailed in Table 2.2.

Subnet	IPv4 Address / Prefix	IPv4 Address Range	IPv6 Address / Prefix	IPv6 Address Range
BT-R001 - BT001	23.0.0.0/28	23.0.0.1 - 23.0.0.14	2001:2300:0:0::/64	2001:2300:0:0::1 - 2001:2300:0:0:ffff:ffff:ffff:fffe

Table 2.2: Interfaces for Each Physical Connection and Corresponding IPv4 and IPv6 Addresses.

2.2 IP Addresses of Interfaces

Assigning IP addresses[1][2] to interfaces should be the first step in building BT Network since all network services listed in 1.1 cannot operate without IP addresses. The assignment of IP addresses in Table 2.1 and 2.2 is implemented.

2.2.1 Implementation

2.2.1.1 Routers

For Router 1 (BT-R001), IP addresses are assigned directly to physical interfaces as all interfaces are network layer interfaces.

```
1 int fa0/0
2 ip address 23.0.0.49 255.255.255.252
3 ipv6 address 2001:2300:0:3::1/64
4 no shutdown
5
6 int fa0/1
7 ip address 23.0.0.57 255.255.255.252
8 ipv6 address 2001:2300:0:5::1/64
9 no shutdown
10
11 int fa0/1/0
12 ip address 23.0.0.1 255.255.255.240
13 ipv6 address 2001:2300:0:0::1/64
14 no shutdown
```

For Router 2 (BT-R002), however, only 2 interfaces (FastEthernet0/0 and FastEthernet0/1) each are network layer interfaces. The remaining 4 interfaces are link layer interfaces and need to be assigned to an VLAN separately so where an IP address can be assigned.

```
1 int fa0/0
2 ip address 23.0.0.50 255.255.255.252
3 ipv6 address 2001:2300:0:3::2/64
4 no shutdown
5
6 int fa0/1
7 ip address 23.0.0.53 255.255.255.252
8 ipv6 address 2001:2300:0:4::1/64
9 no shutdown
10
11 vlan 1
12 int fa0/1/0
13 switchport mode access
14 switchport access vlan 1
```

```
15 int vlan 1
16 ip address 23.0.0.17 255.255.255.240
17 ipv6 address 2001:2300:0:1::1/64
18 no shutdown
19
20 vlan 3
21 int fa0/1/1
22 switchport mode access
23 switchport access vlan 3
24 int vlan 3
25 ip address 23.0.0.61 255.255.255.252
26 ipv6 address 2001:2300:0:6::1/64
27 no shutdown
```

Similarly, IP addresses are assigned to Router 3 (BT-R003).

```
1 int fa0/0
2 ip address 23.0.0.58 255.255.255.252
3 ipv6 address 2001:2300:0:5::2/64
4 no shutdown
5
6 int fa0/1
7 ip address 23.0.0.54 255.255.255.252
8 ipv6 address 2001:2300:4::2/64
9 no shutdown
10
11 vlan 2
12 int fa0/1/0
13 switchport mode access
14 switchport access vlan 2
15 int vlan 2
16 ip address 23.0.0.33 255.255.255.240
17 ipv6 address 2001:2300:0:2::1/64
18 no shutdown
19
20 vlan 4
21 int fa0/1/2
22 switchport mode access
23 switchport access vlan 4
24 int vlan 4
25 ip address 56.0.0.62 255.255.255.252
26 ipv6 address 2001:5600:0:6::2/64
27 no shutdown
28
29 vlan 5
30 int fa0/1/1
31 switchport mode access
32 switchport access vlan 5
```

```
33 int vlan 5
34 ip address 100.100.2.2 255.255.255.252
35 no shutdown
```

2.2.1.2 Laptops

Unlike routers, the IP assignment of laptops' interfaces are more aligned since all laptops are of the same model. On Laptop 1 (BT001), the file `/etc/network/interface` is edited as follows before rebooting to apply changes. Similarly, IP address can be assigned to Laptop 2's (BT002) and Laptop 3's (BT003) interfaces respectively. Full configuration for all laptops are detailed in Appendix C.

```
1 auto lo
2 iface lo inet loopback
3 auto eth0
4 iface eth0 inet static
5 address 23.0.0.2
6 netmask 255.255.255.240
7 gateway 23.0.0.1
8
9 iface eth0 inet6 static
10 address 2001:2300::2
11 netmask 64
12 gateway 2001:2300::1
```

2.2.2 Evaluation

On all 3 routers, the implementation of IP assignments is evaluated using `show ip int brief` and `show ipv6 int brief`. These 2 commands show IPv4 and IPv6 addresses of interfaces on routers respectively. Successful assignment of IP addresses to routers' interfaces is evident from Figure 2.3 and 2.4.

On the laptops' side, the implementation of IP assignments is evaluated using `ifconfig` command. Successful assignment of IP addresses to laptops' interfaces is evident from Figure 2.5.

Figure 2.5: Successful Assignment of IPv4 and IPv6 Addresses to Laptops' Interfaces.

Chapter 3

Routing Protocols in the Network

3.1 Intra-domain Routing Protocol: IS-IS

3.1.1 Design

Due to the limitation of the static routing, routers cannot find alternative paths if a set path is broken and thus a new path need to be set manually. In contrast, dynamic routing always finds the least cost path even when the previous least cost path is broken. Popular dynamic routing protocols include distance vector based protocols like Routing Information Protocol (RIP)[3] and link state based protocols like Intermediate System to Intermediate System (IS-IS)[4] and Open Shortest Path First (OSPF)[5].

In this lab, the IS-IS is used as the Interior Gateway Protocol (IGP), which provides faster convergence and larger scalability compared to distance vector based protocols. IS-IS is short for Intermediate System to Intermediate System Routing Protocol. By using this protocol, each router maintains a database which has a map of the whole topology and all routers have the same information. The best path to every destination is computed by all routers. Figure 3.1 shows the design of IS-IS protocol in BT Network. As the figure shows, the network only has level-1 routers for internal routing.

3.1.2 Loopback Addresses and NSAP for Routers

To set up IS-IS, an unique loopback address is needed for each router. An IPv4 address block of 23.0.255.0/24 and IPv6 address block of 2001:2300:ffff::/48 is allocated for loopback addresses.

Figure 3.1: Design of IS-IS Protocol in BT Network.

Following the CLNS addressing convention, each router is then assigned with a NSAP. A NSAP has 3 main components.

According to the convention, the leading Area ID is composed of AFI (49) and Area Address (0001). The System ID followed is set to the IPv4 loopback address of the router. If the loopback address is *ABC.DEF.GHI.JKL*, then System ID should be *ABCD.EFGH.IJKL*. The last main component is N-Selector (NSEL) and set to 00.

The assignment of addresses and NSAP to routers are detailed in Table 3.1.

Router	IPv4 Loopback Address	IPv6 Loopback Address	NSAP
BT-R001	23.0.255.1	2001:2300:ffff:1::	49.0001.0230.0025.5001.00
BT-R002	23.0.255.2	2001:2300:ffff:2::	49.0001.0230.0025.5002.00
BT-R003	23.0.255.3	2001:2300:ffff:3::	49.0001.0230.0025.5003.00

Table 3.1: IP Loopback Addresses and NSAP for Routers in BT Network.

3.1.3 Implementation

IS-IS is set up on Router 1 (BT-R001) using the following commands.

```
1 interface Loopback0
2 ip address 23.0.255.1 255.255.255.255
3 ipv6 address 2001:2300:FFFF:1::/128
4
5 router isis
6 net 49.0001.0230.0025.5001.00
7 is-type level-1
```

Then, IS-IS is turned on on all interfaces to internal routers.

```
1 interface FastEthernet0/0
2 ip router isis
3 ipv6 router isis
4
5 interface FastEthernet0/1
6 ip router isis
7 ipv6 router isis
8
9 interface FastEthernet0/1/0
10 ip router isis
11 ipv6 router isis
```

However, IS-IS routes should not be broadcasted nor received through the loopback interface (Loopback0) while the route to corresponding subnet should be broadcasted to other internal routers. Therefore, the loopback interface should be a passive interface in IS-IS protocol.

```
1 router isis
2 passive-interface Loopback0
```

For Router 2 (BT-R002) and Router 3 (BT-R002), IS-IS is set up similarly using the above commands. The main difference is that interfaces to external routers (VLAN 3 for Router 2 and VLAN 4 & 5 for Router 3) should be passive interfaces as well. Below is the configuration for Router 2.

```
1 interface Loopback0
2 ip address 23.0.255.2 255.255.255.255
3 ipv6 address 2001:2300:FFFF:2::/128
4
5 router isis
6 net 49.0001.0230.0025.5002.00
7 is-type level-1
8 passive-interface Vlan3
9 passive-interface Loopback0
```

```
10
11 interface FastEthernet0/0
12 ip router isis
13 ipv6 router isis
14
15 interface FastEthernet0/1
16 ip router isis
17 ipv6 router isis
18
19 interface Vlan1
20 ip router isis
21 ipv6 router isis
```

Below is the configuration for Router 3.

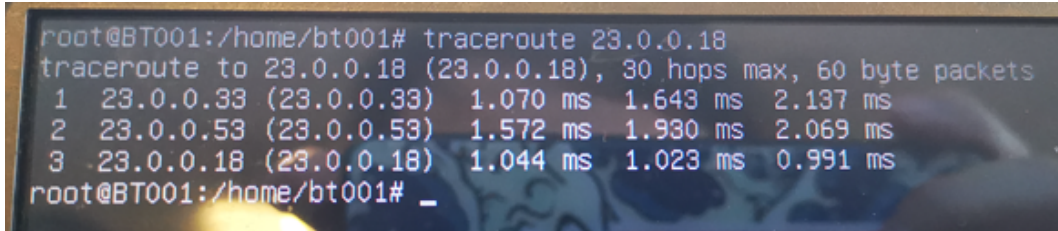

```
1 interface Loopback0
2 ip address 23.0.255.3 255.255.255.255
3 ipv6 address 2001:2300:FFFF:3::/128
4
5 router isis
6 net 49.0001.0230.0025.5003.00
7 is-type level-1
8 passive-interface Vlan4
9 passive-interface Vlan5
10 passive-interface Loopback0
11
12 interface FastEthernet0/0
13 ip router isis
14 ipv6 router isis
15
16 interface FastEthernet0/1
17 ip router isis
18 ipv6 router isis
19
20 interface Vlan2
21 ip router isis
22 ipv6 router isis
```

3.1.4 Evaluation

Once the IS-IS is set up, use `traceroute` command to check the IPv4 path from Laptop 1 (BT001, IPv4 Address: 23.0.0.2) to Laptop 2 (BT002, IPv4 Address: 23.0.0.18) in the network.

```
1 traceroute 23.0.0.34
```

Figure 3.2 shows the route taken is Laptop 1 (BT001, IPv4 Address: 23.0.0.2) -> Router 1 (BT-R001, IPv4 Address: 23.0.0.1) -> Router 2 (BT-R002, IPv4 Address: 23.0.0.50) -> Laptop 2 (BT002, IPv4 Address: 23.0.0.18), which is a correct route. Routes from Laptop 1 to Laptop 3 as well as from Laptop 2 to Laptop 3 are tested and shown in the figure as well.

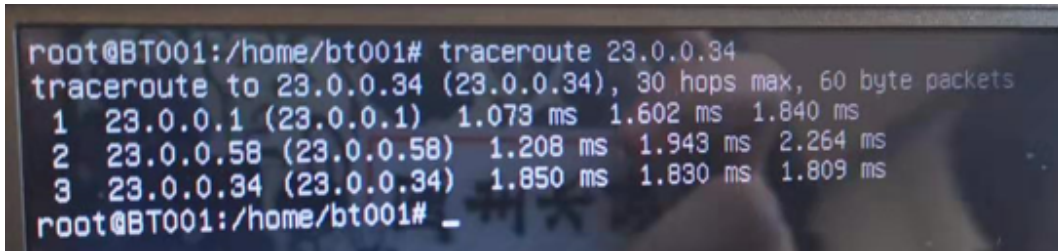

```

root@BT001:/home/bt001# traceroute 23.0.0.18
traceroute to 23.0.0.18 (23.0.0.18), 30 hops max, 60 byte packets
 1  23.0.0.33 (23.0.0.33)  1.070 ms  1.643 ms  2.137 ms
 2  23.0.0.53 (23.0.0.53)  1.572 ms  1.930 ms  2.069 ms
 3  23.0.0.18 (23.0.0.18)  1.044 ms  1.023 ms  0.991 ms
root@BT001:/home/bt001# _

```

(a) `traceroute` from Laptop 1 (BT001) to Laptop 2 (BT002)

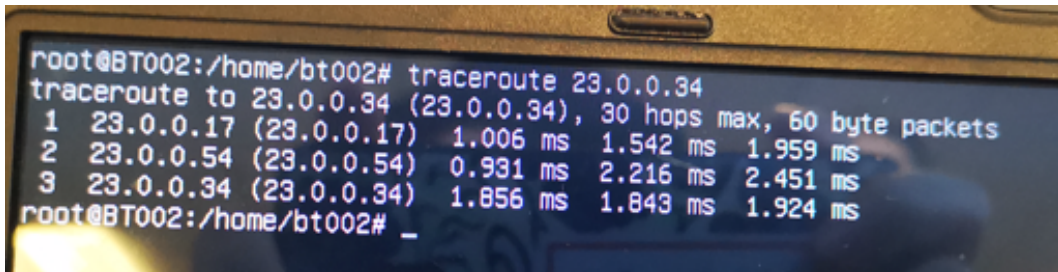

```

root@BT001:/home/bt001# traceroute 23.0.0.34
traceroute to 23.0.0.34 (23.0.0.34), 30 hops max, 60 byte packets
 1  23.0.0.1 (23.0.0.1)  1.073 ms  1.602 ms  1.840 ms
 2  23.0.0.58 (23.0.0.58)  1.208 ms  1.943 ms  2.264 ms
 3  23.0.0.34 (23.0.0.34)  1.850 ms  1.830 ms  1.809 ms
root@BT001:/home/bt001# _

```

(b) `traceroute` from Laptop 1 (BT001) to Laptop 3 (BT003)

```

root@BT002:/home/bt002# traceroute 23.0.0.34
traceroute to 23.0.0.34 (23.0.0.34), 30 hops max, 60 byte packets
 1  23.0.0.17 (23.0.0.17)  1.006 ms  1.542 ms  1.959 ms
 2  23.0.0.54 (23.0.0.54)  0.931 ms  2.216 ms  2.451 ms
 3  23.0.0.34 (23.0.0.34)  1.856 ms  1.843 ms  1.924 ms
root@BT002:/home/bt002# _

```

(c) `traceroute` from Laptop 2 (BT002) to Laptop 3 (BT003)

Figure 3.2: Tracing IPv4 Routes between Laptops using `traceroute`.

Similar results can be observed for IPv6 routes in Figure 3.3. The IPv6 Route taken from Laptop 1 to Laptop 2 is Laptop 1 (BT001, IPv6 Address: 2001:2300::2) -> Router 1 (BT-R001, IPv6 Address: 2001:2300::1) -> Router 2 (BT-R002, IPv6 Address: 2001:2300:3:2::2) -> Laptop 2 (BT002, IPv6 Address: 2001:2300:0:1::2), which is also a correct route. Routes from Laptop 1 to Laptop 3 as well as from Laptop 2 to Laptop 3 are tested and shown in the figure as well.

```

root@BT001:/home/bt001# traceroute 2001:2300:0:1::2
traceroute to 2001:2300:0:1::2 (2001:2300:0:1::2), 30 hops max, 80 byte packets
 1 2001:2300::1 (2001:2300::1) 1.295 ms 1.656 ms 1.954 ms
 2 2001:2300:0:3::2 (2001:2300:0:3::2) 1.578 ms 1.747 ms 1.858 ms
 3 2001:2300:0:1::2 (2001:2300:0:1::2) 1.088 ms 1.061 ms 1.033 ms
root@BT001:/home/bt001#

```

(a) `traceroute` from Laptop 1 (BT001) to Laptop 2 (BT002)

```

root@BT001:/home/bt001# traceroute 2001:2300:0:2::2
traceroute to 2001:2300:0:2::2 (2001:2300:0:2::2), 30 hops max, 80 byte packets
 1 2001:2300::1 (2001:2300::1) 1.287 ms 1.560 ms 1.804 ms
 2 2001:2300:0:5::2 (2001:2300:0:5::2) 1.500 ms 1.720 ms 1.842 ms
 3 2001:2300:0:2::2 (2001:2300:0:2::2) 1.075 ms 1.061 ms 1.095 ms
root@BT001:/home/bt001#

```

(b) `traceroute` from Laptop 1 (BT001) to Laptop 3 (BT003)

```

bt002@BT002:~$ traceroute 2001:2300:0:2::2
traceroute to 2001:2300:0:2::2 (2001:2300:0:2::2), 30 hops max, 80 byte packets
 1 2001:2300:0:1::1 (2001:2300:0:1::1) 1.446 ms 1.753 ms 2.091 ms
 2 2001:2300:0:4::2 (2001:2300:0:4::2) 1.439 ms 1.632 ms 1.765 ms
 3 2001:2300:0:2::2 (2001:2300:0:2::2) 1.065 ms 1.062 ms 1.036 ms
bt002@BT002:~$

```

(c) `traceroute` from Laptop 2 (BT002) to Laptop 3 (BT003)

Figure 3.3: Tracing IPv6 Routes between Laptops using `traceroute`.

To further evaluate the correctness of our implementation, we check the path from Laptop 1 to Laptop 2 under the condition that the physical connection between Router 1 and Router 2 is broken. The IS-IS protocol on Router 1 should be able to find route to Router 2 through Router 3.

Figure 3.4 shows the IPv4 route taken is Laptop 1 (BT001, IPv4 Address: 23.0.0.2) -> Router 1 (BT-R001, IPv4 Address: 23.0.0.1) -> Router 3 (BT-R003, IPv4 Address: 23.0.0.58) -> Router 2 (BT-R002, IPv4 Address: 23.0.0.53) -> Laptop 2 (BT002, IPv4 Address: 23.0.0.18), which is a correct route.

Figure 3.4: Tracing IPv4 Routes from Laptop 2 (BT002) to Laptop 3 (BT003) when Physical Connection between Router 1 (BT-R001) and Router 2 (BT-R002) is broken.

Figure 3.5 shows the IPv6 route taken is Laptop 1 (BT001, IPv6 Address: 2001:2300::2) -> Router 1 (BT-R001, IPv6 Address: 2001:2300::1) -> Router 3 (BT-R003, IPv6 Address: 2001:2300:0:5::2) -> Router 2 (BT-R002, IPv6 Address: 2001:2300:0:4::1) -> Laptop 2 (BT002, IPv6 Address: 2001:2300:0:1::2), which is also a correct route.

Figure 3.5: Tracing IPv6 Routes from Laptop 2 (BT002) to Laptop 3 (BT003) when Physical Connection between Router 1 (BT-R001) and Router 2 (BT-R002) is broken.

CHAPTER 3. ROUTING PROTOCOLS IN THE NETWORK

On the router's side, `show ip route` and `show ipv6 route` is used to inspect the routes discovered by IS-IS protocol. In Figure 3.6 and 3.7, such routes to other subnets inside BT Network on each router are shown.

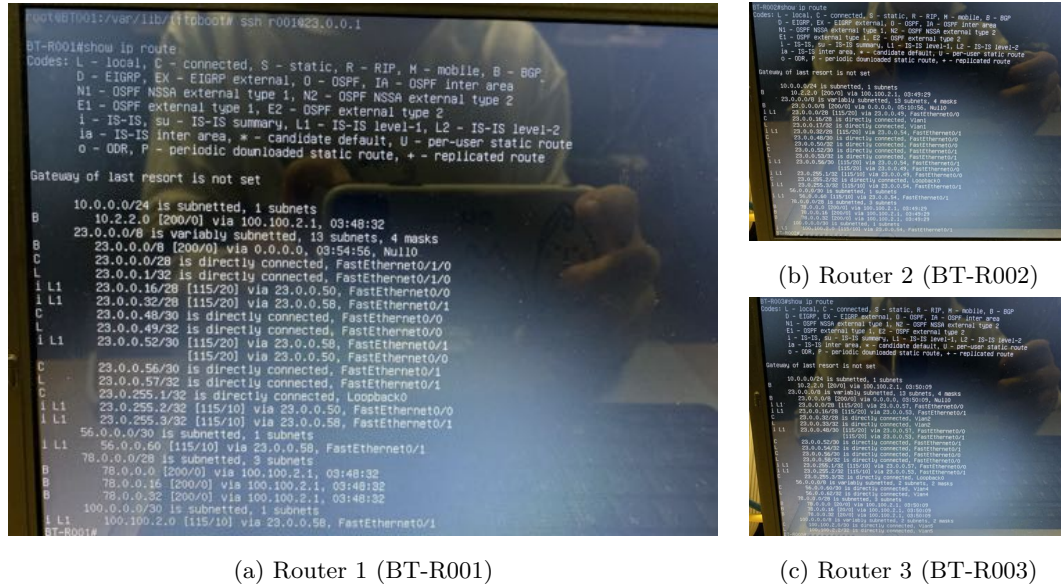

Figure 3.6: IPv4 Routes to Other Subnets on All 3 Routers Respectively using `show ip route`.

(c) Router 3 (BT-R003)

Figure 3.7: IPv6 Routes to Other Subnets on All 3 Routers Respectively using `show ipv6 route`.

Noticably, when the physical connection between Router 1 and Router 2 is broken, the route from Router 1 to Router 2 goes through Router 3 instead, as evident in Figure 3.8.

3.1.5 Commentary

3.1.5.1 Problem: IS-IS Not Set Up for Laptop-Router Interface

When initially setting up IS-IS on the interfaces, only the interfaces between routers have been turned on. This leads to laptop's failure to reach a router not directly connected. To solve this problem, IS-IS is set up on the interface between a laptop and a router.

3.1.5.2 Alternative Solution to Passive Interfaces

While turning interfaces connected to outside network into passive interfaces does enable other routers in the network to connect to outside networks through those interfaces, it demands extra computing resource for computing routes to external subnets.

Alternatively, one can disable IS-IS on such interfaces and replace the external next-hop for each out-going route in BGP with the internal router to which the next-hop is directly connected to. That prevents Router-Neighbour subnet from participating in IS-IS routing and eliminates the extra computing consumption while preserving the connectivity between internal routers and outside networks.

(b) IPv6 Routes to Other Subnets on Router 1 using show ip route.

Figure 3.8: IP Routes to Other Subnets on Router 1 when Physical Connection between Router 1 (BT-R001) and Router 2 (BT-R002) is broken.

3.2 Inter-domain Routing Protocol: BGP

3.2.1 Design

For inter-domain routing, Border Gateway Protocol (BGP)[6] is applied in BT Network since it's the one and only External Gateway Protocol (EGP) in today's global Internet. BGP provides scalability to large networks, clear definitions of administrative boudnary as well as flexiable policy control, which allow business relaitonships with neighbouring ISPs to be expressed in terms of routing policies.

Figure 3.9 shows the design of BGP protocol in our network. The AS Number (ASN) of BT Network is 2030 while ASN of Central, Virgin, DT are 42, 5060, 3040 respectively.

Figure 3.9: Design of BGP Protocol in BT Network.

Router 2 (BT-R002) and Router 3 (BT-R003) act as External BGP routers since they are directly connected to neighbouring ISPs. They receive routes announced by neighbouring ISPs' routers and announce routes originated from BT Network. Router 1 (BT-R001) acts

as an Internal BGP (IBGP) router only since it is not directly connected to any neighbouring ISP and only forwards and receives routes announced by EGBP routers.

3.2.2 Routing Policies

To enact business relationships with neighbouring ISPs, proper routing policies should be implemented for each different relationship in BGP protocol. Specifically, for customer ISPs, all routes announced by such ISP should be accepted and all routes received should be announced to it as well. This allows customers to connect to BT Network as well as connect to other networks through BT Network.

For non-customer neighbouring ISPs (peers and providers), all routes announced by such ISP should be accepted in order for BT Network to connect to it. Meanwhile, only routes originated from either BT Network or BT's customers are announced to such ISP.

3.2.3 Implementation

On Router 1 (BT-R001, IPv4 Loopback Address: 23.0.255.1, IPv6 Loopback Address: 2001:2300:FFFF:1::), both Router 2 (BT-R002, IPv4 Loopback Address: 23.0.255.2, IPv6 Loopback Address: 2001:2300:FFFF:2::) and Router 3 (BT-R003, IPv4 Loopback Address: 23.0.255.3, IPv6 Loopback Address: 2001:2300:FFFF:3::) are taken as neighbouring routers in the same AS. In addition, the source of BGP messages are set to be the loopback address of Router 1 to prevent physical disconnection to the 2 routers. Router 1 announces the subnet BT-R001 - BT001 (IPv4: 23.0.0.0/28, IPv6: 2001:2300:0:0::/64) to other routers.

```
1 router bgp 2030
2 network 23.0.0.0 mask 255.255.255.240
3 neighbor 23.0.255.2 remote-as 2030
4 neighbor 23.0.255.2 update-source Loopback0
5 neighbor 23.0.255.3 remote-as 2030
6 neighbor 23.0.255.3 update-source Loopback0
7 neighbor 2001:2300:FFFF:2:: remote-as 2030
8 neighbor 2001:2300:FFFF:2:: update-source Loopback0
9 neighbor 2001:2300:FFFF:3:: remote-as 2030
10 neighbor 2001:2300:FFFF:3:: update-source Loopback0
11
12 address-family ipv6
13 network 2001:2300::/64
14 neighbor 2001:2300:FFFF:2:: activate
15 neighbor 2001:2300:FFFF:3:: activate
```

On Router 2 (BT-R002), both Router 1 and Router 3 are taken as neighbouring routers in the same AS while the router from DT is taken as router from AS 3040. Router 2 announces

the subnet BT-R002 - BT002 (IPv4: 23.0.0.16/28, IPv6: 2001:2300:0:1::/64) to other routers. Since Router 2 is directly connected to customer DT Network, it applies no filter on inbound and outbound routes.

```

1 router bgp 2030
2 network 23.0.0.16 mask 255.255.255.240
3 neighbor 23.0.0.62 remote-as 3040
4 neighbor 23.0.255.1 remote-as 2030
5 neighbor 23.0.255.1 update-source Loopback0
6 neighbor 23.0.255.3 remote-as 2030
7 neighbor 23.0.255.3 update-source Loopback0
8 neighbor 2001:2300:0:6::2 remote-as 3040
9 neighbor 2001:2300:FFFF:1:: remote-as 2030
10 neighbor 2001:2300:FFFF:1:: update-source Loopback0
11 neighbor 2001:2300:FFFF:3:: remote-as 2030
12 neighbor 2001:2300:FFFF:3:: update-source Loopback0
13
14 address-family ipv6
15 network 2001:2300:0:1::/64
16 neighbor 2001:2300:0:6::2 activate
17 neighbor 2001:2300:FFFF:1:: activate
18 neighbor 2001:2300:FFFF:3:: activate

```

On Router 3 (BT-R003), both Router 1 and Router 2 are taken as neighbouring routers in the same AS while the routers from Central and Virgin are taken as router from AS 42 and AS 5060 respectively. Router 3 announces the subnet BT-R003 - BT003 (IPv4: 23.0.0.32/28, IPv6: 2001:2300:0:2::/64) to other routers.

```

1 router bgp 2030
2 network 23.0.0.32 mask 255.255.255.240
3 neighbor 23.0.255.1 remote-as 2030
4 neighbor 23.0.255.1 update-source Loopback0
5 neighbor 23.0.255.2 remote-as 2030
6 neighbor 23.0.255.2 update-source Loopback0
7 neighbor 2001:2300:FFFF:1:: remote-as 2030
8 neighbor 2001:2300:FFFF:1:: update-source Loopback0
9 neighbor 2001:2300:FFFF:2:: remote-as 2030
10 neighbor 2001:2300:FFFF:2:: update-source Loopback0
11 neighbor 2001:5600:0:6::1 remote-as 5060
12 neighbor 56.0.0.61 remote-as 5060
13 neighbor 100.100.2.1 remote-as 42
14
15 address-family ipv6
16 network 2001:2300:0:2::/64
17 aggregate-address 2001:2300::/32 summary-only
18 neighbor 2001:2300:FFFF:1:: activate
19 neighbor 2001:2300:FFFF:2:: activate

```

Since Router 3 is directly connected to non-customer ISPs, it applies a filter on outbound routes, which denies all routes that pass through either Central Network (ASN: 42) or Virgin Network (ASN: 5060).

```
1 ip as-path access-list 1 deny _42_  
2 ip as-path access-list 1 deny _5060_  
3 ip as-path access-list 1 permit .  
4 router bgp 2030  
5 neighbor 56.0.0.61 filter-list 1 out  
6 neighbor 100.100.2.1 filter-list 1 out
```

Address aggregation for 23.0.0.0/8 and 2001:2300::/32 is set up on all 3 routers, which aggregates routes destined for all addresses inside BT Network range into a single route.

```
1 aggregate-address 23.0.0.0 255.0.0.0 summary-only  
2 address-family ipv6  
3 aggregate-address 2001:2300::/32 summary-only
```

3.2.4 Evaluation

3.2.4.1 BGP Routes

Routes collected through BGP protocol on all 3 routers are shown in Figure 3.10 and ?? using commands `show bgp` and `show bgp ipv6`. Routes to DT Network (IPv4: 34.0.0.0/8, IPv6: 2001:3400::/32), Virgin Network (IPv4: 56.0.0.0/8, IPv6: 2001:5600::/32), Central Network (IPv4: 10.2.2.0/24) and other networks can be observed in the figure.

3.2.4.2 Connectivity to Provider Central Network

The connectivity to provider Central Network using BGP protocol is tested and evaluated by tracing routes to IP addresses 10.2.2.1 on Laptop 1 (BT001). As shown in Figure 3.11, connection to Central Network is successfully established through BGP routes.

(a) 10.2.2.1

Figure 3.11: Tracing IPv4 Routes to Central Network on Laptop 1 (BT001) using traceroute.

3.2.4.3 Connectivity to Customer DT Network

The connectivity to customer DT Network using BGP protocol is tested and evaluated by tracing routes to IP addresses 34.0.0.2, 34.0.0.18 and 34.0.0.34 on Laptop 1 (BT001). As shown in Figure 3.12, connection to DT Network is successfully established through BGP routes.

```

(b) 89.0.0.18

Figure 3.14: Tracing IPv4 Routes to Other Networks on Laptop 1 (BT001) using traceroute.

3.2.4.6 Connectivity to Virgin when Direct Physical Connection Is Down

In addition, the connectivity to peer Virgin Network under the unfortunate condition that the direct physical connection is down is also tested. Traced routes to IP addresses 56.0.0.2, 56.0.0.18 and 56.0.0.34 on Laptop 1 (BT001) are shown in Figure 3.15.

Alternative connection to Virgin Network is successfully established through Central Network (ASN: 42).

3.2.5 Commentary

3.2.5.1 Problem: Filter List Not Working for Self-Originated Routes

The initial filter list for outbound routes on Router 3 only permits routes originated from BT Network (ASN 2030) and customer DT Network (ASN 3040).

```
1 ip as-path access-list 1 permit _2030$
2 ip as-path access-list 1 permit _3040$
```

However, the filter list blocks all routes except those originated from customer DT Network to be announced. To solve this problem, a filter list where all routes except those go through provider Central Network (ASN 42) and peer Virgin Network (ASN 5060) are allowed. The new list should have the same effects as the previous list and indeed works as intended.

```
1 ip as-path access-list 1 deny _42_
2 ip as-path access-list 1 deny _5060_
3 ip as-path access-list 1 permit .*
```

```

Figure 3.15: Tracing IPv4 Routes to Virgin Network on Laptop 1 (BT001) using `traceroute` When Direct Physical Connection Is Broken .

Chapter 4

Applications in the Network

4.1 Secure Remote Access to Routers through SSH

4.1.1 Design

Accessing the routers through the physical "console" port is inconvenient and dangerous. Thus, remote access through Secure Shell (SSH) protocol[7] to routers is needed.

In BT network, remote SSH access is enabled on all 3 routers. Seperate combinations of username and password on each router are used to ensure the independence of security of each router.

In addition, SSH public key authentication is set up on Laptop 1 (BT001), which allows the root user on the laptop to login in to all routers without entering passwords.

4.1.2 Implementation

We first set up Remote SSH access was first set up as instructed in Reference Guide on all 3 routers. Below is the configuration commands for Router 1 (BT-R001).

```
1 hostname BT-R001
2 ip domain name bt.lboro
3 username r001 priv 15 secret <secret>
4 line vty 0 4
5 transport input ssh telnet
6 login local
7
8 ip ssh version 2
9 crypto key generate rsa general-keys
10 ip ssh dh min size 4096
```

We then generate a pair of public and private keys on Laptop 1 (BT001).

```
1 ssh-keygen
```

After that, the pair of keys is written into files `~/.ssh/id_rsa` and `~/.ssh/id_rsa.pub`. We use the generated public key (`id_rsa.pub`) to set up SSH public key authentication on all 3 routers.

```
1 ip ssh pubkey-chain
2 username r001
3 key-string
```

4.1.3 Evaluation

Once remote SSH access is set up on 3 routers, one should be able to access them on Laptop 1 (BT001) without entering the password using the following commands.

```
1 # access Router 1
2 ssh r001@23.0.0.1
3 # access Router 2
4 ssh r002@23.0.0.50
5 # access Router 3
6 ssh r003@23.0.0.33
```

Screenshots of successful remote access to all 3 routers are shown in Figure 4.1.

(a) Router 1 (BT-R001)

(b) Router 2 (BT-R002)

(c) Router 3 (BT-R003)

Figure 4.1: Successful remote SSH access to all 3 routers from Laptop 1 (BT001).

4.1.4 Commentary

4.1.4.1 Problem: Maximum Limit of Characters per Line

When we tried to set up SSH public key authentication on routers, we failed at our initial attempt. It turned out that Cisco router has maximum limit of characters for each command line. Thus, a public key in a single long line was not accepted by the router.

To solve this problem, `fold` command is used to split the public key into multiple lines before re-uploading the key and SSH public key authentication was successfully set up on the router.

4.2 Domain Name System Service

4.2.1 Design

Domain Name System (DNS)[8] translates IP addresses to domain names and vice versa. In contrast to hard-to-remember IP addresses, short and meaningful domain names (eg. `lboro.ac.uk` for Loughborough University in UK) are more convenient for Internet users. Additionally, the service providers can change the IP addresses of servers without re-notifying their customers.

In BT Network, there are two DNS servers, one primary master server and the other secondary. Primary master server is deployed at Laptop 3 (BT003) and secondary master server is at Laptop 1 (BT001). The rationale is that when the primary becomes unavailable, the secondary can be the backup domain name server.

Both are authoritative of domain `bt.lboro`. **Each laptop in the network has a corresponding domain name. For example, the domain name of Laptop 1 (BT001) is `bt001.bt.lboro`. In addition, both A and AAAA records of `bt.lboro` point to Laptop 1 while the MX record points to Laptop 3.**

The two DNS servers are also connected to the central DNS server, which is authoritative of domain `lboro`.

4.2.2 Implementation

Install `bind9` package and `dnsutils` package on Laptop 1 (BT001) and Laptop 3 (BT001) using the following commands. All DNS configurations are all stored in folder `/etc/bind`.

```
1 sudo apt-get install bind9
2 sudo apt-get install dnsutils
```

On the primary DNS server, forward unknown DNS requests to central DNS server by adding this line to file `named.conf.options`.

```
1 forwarders { 10.2.2.1; };
```

The following lines are added to file `/etc/bind/named.conf.local`.

The zone section defines the type of the DNS server and it is stored in a file mentioned in the 'file' field. The 'allow-transfer' field defines a match list which has IP addresses that are allowed to do transfer and copy operations to the zone information with the server. The 'allow-notify' field defines an IP addresses match list that is allowed to notify this server and implicitly update the zone. In this case, both fields should be the IP address of the secondary DNS server (Laptop 1).

CHAPTER 4. APPLICATIONS IN THE NETWORK

The first zone is a forward zone which translate the domain name to IP address. The zone name of it is the selected domain name `bt.lboro`. The second zone is the reverse zone which translate the IP address to domain name. The zone name of it should be the fixed IP prefix part and host part. In this case, the name is `23.in-addr.arpa`.

```
1 zone    bt.lboro    {
2     type master;
3     file    /etc/bind/db.bt.lboro ;
4     allow-transfer { 23.0.0.2; };
5     also-notify { 23.0.0.2; };
6 };
7
8 zone    23.in-addr.arpa    {
9     type master;
10    file    /etc/bind/db.23 ;
11    allow-transfer { 23.0.0.2; };
12    also-notify { 23.0.0.2; };
13 };
```

Then, the files related to forward zone and reverse zone are edited. The file `db.bt.lboro` whose contents are shown in Listing 4.1 defines the forward DNS configuration.

```
1 ;
2 ; BIND data file for BT.LBORO
3 ;
4 $TTL 604800
5 @ IN SOA bt.lboro. root.bt.lboro. (
6     13 ; Serial
7     604800 ; Refresh
8     86400 ; Retry
9     2419200 ; Expire
10    604800 ) ; Negative Cache TTL
11 ;
12 @ IN NS ns.bt.lboro.
13 @ IN NS ns2.bt.lboro.
14 www IN CNAME bt.lboro.
15 ns IN A 23.0.0.34
16 ns IN AAAA 2001:2300:0:2::2
17 ns2 IN A 23.0.0.2
18 ns2 IN AAAA 2001:2300:0:0::2

24 bt002 IN A 23.0.0.18
25 bt002 IN AAAA 2001:2300:0:1::2
```

```

26 bt003 IN A 23.0.0.34
27 bt003 IN AAAA 2001:2300:0:2::2

```

Listing 4.1: Contents of Forward DNS Configuration File Located at `/etc/bind/db.bt.lboro` on Primary DNS Server (Laptop 3).

Serial number is the version number of this file and it should be increased after changing the file. For each line of records, the prefix (eg. `bt001`), domain type (eg. `A`) and value (eg. `23.0.0.2`) are specified.

```

1 ;
2 ; BIND reverse data file for 23.xxx.xxx.xxx net
3 ;
4 $TTL 604800
5 @ IN SOA ns.bt.lboro. root.bt.lboro. (
6     7 ; Serial
7     604800 ; Refresh
8     86400 ; Retry
9     2419200 ; Expire
10    604800 ) ; Negative Cache TTL
11 ;
12 @ IN NS ns.
13 2.0.0 IN PTR bt.lboro.
14 34.0.0 IN PTR ns.bt.lboro.
15 2.0.0 IN PTR ns2.bt.lboro.
16 2.0.0 IN PTR bt001.bt.lboro.
17 18.0.0 IN PTR bt002.bt.lboro.
18 34.0.0 IN PTR bt003.bt.lboro.

```

Listing 4.2: Contents of Reverse DNS Configuration File Located at `/etc/bind/db.23` on Primary DNS Server (Laptop 3).

Listing 4.2 shows the configuration for the reverse zone. The serial number needs to be increased on each change as well. For each line of records, the first column of match list should be reverse host part of IP address. For example, the IP address of Laptop 1 (BT001) is `23.0.0.2` and the host part of it is `0.0.2`. Therefore, the reverse host part of it should be `2.0.0`.

For each A record in forward configurations, a PTR records should be added to the reverse configuration.

When all configurations for DNS server are completed, use following commands to restart `bind9` service to take effect.

```

1 service bind9 restart

```

As for secondary master, Laptop 1 (BT001) only needs to add the following lines to the file `/etc/bind/named.conf.local`, which specify both forward and reverse DNS zones and Laptop 3 as their master server.

```
1 zone    bt.lboro    {
2         type slave;
3         file    db.bt.lboro    ;
4         masters { 23.0.0.34; };
5 };
6
7 zone    23.in-addr.arpa    {
8         type slave;
9         file    db.23    ;
10        masters { 23.0.0.34; }
11 };
```

Restart `bind9` service for configurations to take effect.

```
1 service bind9 restart
```

Now, Laptop 1 should be able to receive DNS records from the master server and act as a secondary DNS server.

On client's side, Laptop 3 and 2 are set as nameservers in file `/etc/network/interfaces` on all 3 laptops.

```
1 dns-nameservers 23.0.0.34 23.0.0.2
```

Full configurations for both primary and secondary DNS server are detailed in Appendix D.

4.2.3 Evaluation

The command `dig` is used to query DNS records on Laptop 2 for evaluation. In Figure 4.2, DNS records of `bt.lboro` and `www.bt.lboro` are "digged" and correct answers are returned by DNS servers.

In addition, DNS records of `bt001.bt.lboro`, `bt002.bt.lboro` and `bt003.bt.lboro` are "digged" on Laptop 2 as well. In Figure 4.3, correct answers are returned by DNS servers.

In terms of IPv6 addresses, DNS AAAA records of `bt001.bt.lboro`, `bt002.bt.lboro` and `bt003.bt.lboro` are "digged" on Laptop 2 as well. In Figure 4.4, correct answers are returned by DNS servers.

For reverse DNS, records of Laptop 1 (23.0.0.2), Laptop 2 (23.0.0.18) and Laptop 3 (23.0.0.34) are "digged" on Laptop 2 as well. In Figure 4.5, correct answers are returned by DNS servers.

Figure 4.2: Querying DNS Records for bt.lboro and www.bt.lboro on Laptop 2.

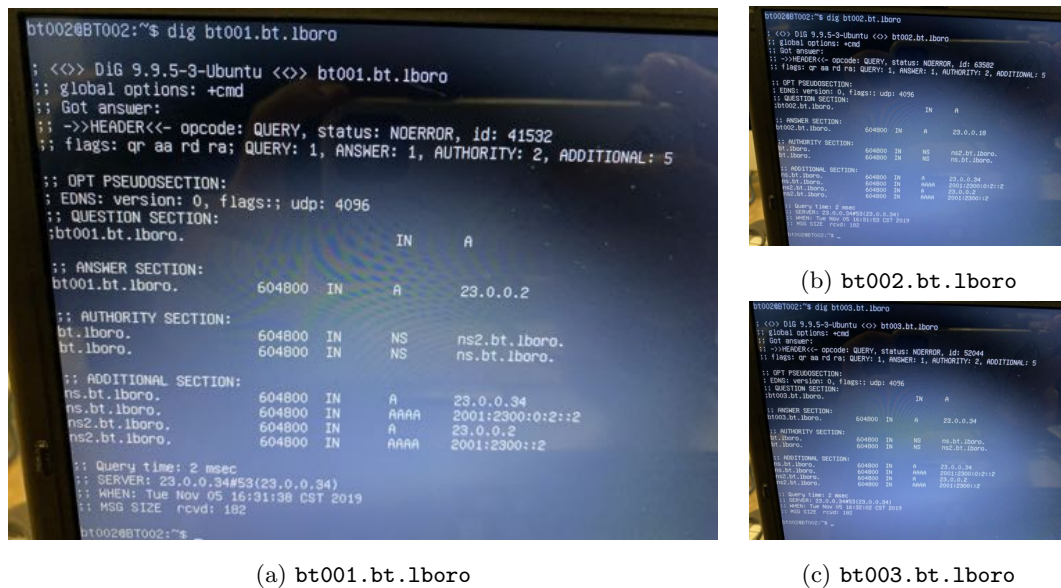

Figure 4.3: Querying DNS Records for sub-domains of bt.lboro on Laptop 2.

In terms of connectivity, all three laptops are able to directly ping the domain name bt.lboro, whose DNS A record points to Laptop 1 (BT001, IPv4 Address: 23.0.0.2), as shown in Figure 4.6.

CHAPTER 4. APPLICATIONS IN THE NETWORK

(c) Laptop 3 (BT003)

Figure 4.6: Connectivity to bt.lboro using ping on all 3 Laptops.

Under the unfortunate condition that the primary server (Laptop 3) is disconnected from the Internet, availability of DNS service in BT is also tested. As shown in Figure 4.7, DNS records are successfully retrived from the secondary DNS server (Laptop 2, IPv4 Address: 23.0.0.2) despite the fact that the primary server is down.

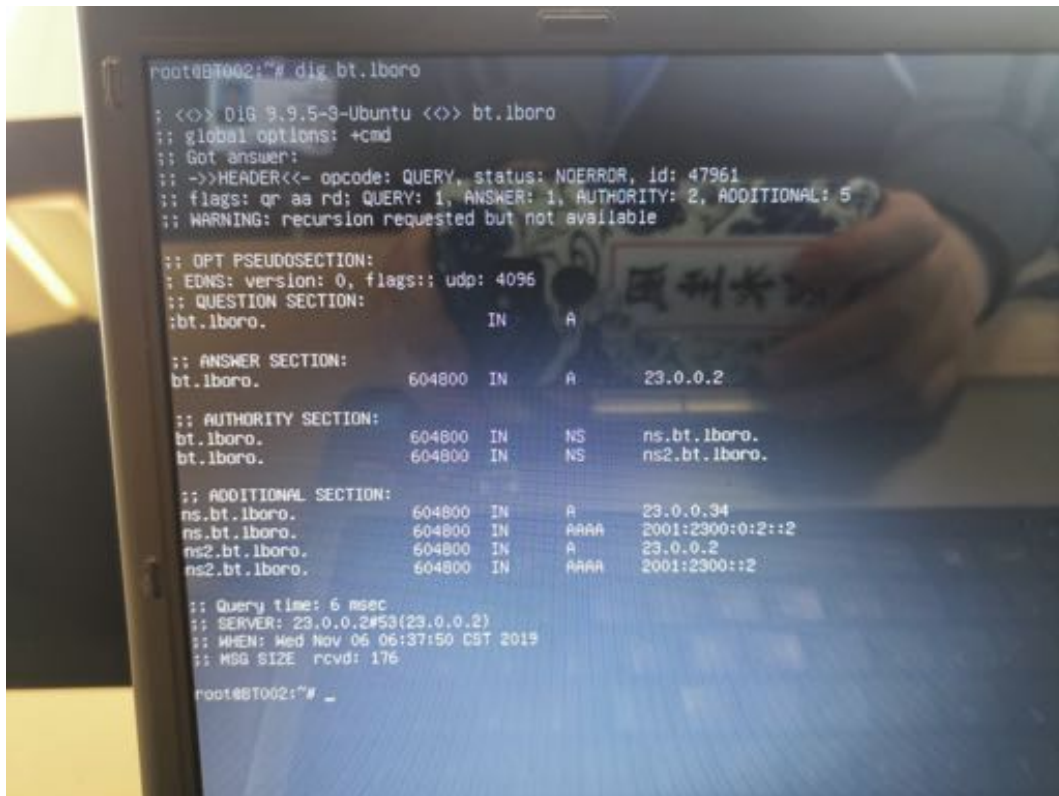

Figure 4.7: Querying DNS Records for `bt.lboro` on Laptop 2 When Primary DNS Server (Laptop 3) Is Down.

4.2.4 Commentary

4.2.4.1 Problem: Querying IPv6 DNS Records

Using `dig` directly does not return IPv6 addresses for domains. It turns out that `dig` queries A records by default. To query IPv6 DNS records, `dig AAAA domain-name` should be used.

4.2.4.2 Problem: Reverse DNS Not Working

Using `dig -x 23.0.0.2` does not return any answer initially. It's later realized that the reverse DNS zone name has been wrongly set to `0.0.23.in-addr.arpa`.

To set up reverse DNS properly, the DNS zone should be `3.in-addr.arpa`. In addition, the first column for each DNS record inside file `db.23` should be the reverse host name (eg. `2.0.0` for IP address `23.0.0.2`).

4.3 World Wide Web Service

4.3.1 Design

A World Wide Web (WWW) service[9][10] in the network allows any terminal devices to access the deployed webpages. The service in BT Network is established after routers and three laptops have been configured and DNS service been set up.

For this lab, **apache2** package is chosen as the tool to establish the web server on Laptop 1 (BT001). Using the default settings of this package is enough and it has a specific folder static web pages are stored.

4.3.2 Implementation

Install **apache2** package on Laptop 1 (BT001, IPv4 Address: 23.0.0.2) using following the command.

```
1 sudo apt-get install apache2
```

A HTML file named **index.html** is created as a test webpage, as detailed in Figure 4.8.

```
1 <html>
2 <header><title>BT Network</title></header>
3 <body>
4 <h1>Welcome to BT Network |</h1>
5 A Trustworthy Internet Service Provider at Loughborough University.
6 </body>
7 </html>
```

Figure 4.8: Contents of HTML File Named **index.html**

Then, the HTML file is copied to the folder **/var/www/html**. This folder is used to deploy webpages on the server. And the meaning of **-r** is to cover the same name file.

```
1 cp -r index.html /var/www/html
```

Then, install **links** package which is a command-line Web browser in Linux by using following command.

```
1 sudo apt-get install links
```

Then, **links** is started and the web page is accessed through URL with the local IP address.

```
1 links http://23.0.0.2/
```

Finally, add the following lines to the forward DNS file `/etc/bind/db.bt.lboro` on Primary DNS Server at Laptop 3 (BT003). This enables the clients to browse the webpages by domain name `bt.lboro`.

```
1 @ IN A 23.0.0.2
2 @ IN AAAA 2001:2300:0:0::2
```

4.3.3 Evaluation

The web service is tested using the following command on Laptop 2, which is neither a DNS Server not a Web Server.

```
1 links http://bt.lboro/
```

As shown in Figure 4.9, the service has been successfully set up and is accessible in the network.

Figure 4.9: Web Service Provided at `http://bt.lboro` .

4.4 Email Service

4.4.1 Design

Email service[11] allows users to communicate with each other based on texts. In BT Network, it is set up using `exim4` package on Laptop 3 (BT003).

4.4.2 Implementation

On Laptop 3 (BT003), the package `exim4` is installed and configured. Important steps in the configuration are shown in 4.10.

```
1 apt-get install exim4
2 dpkg-reconfigure exim4-config
```

The full configuration of Email service is detailed in Appendix E.

4.4.3 Evaluation

For evaluation, the following command are used to send a mail to DT Network.

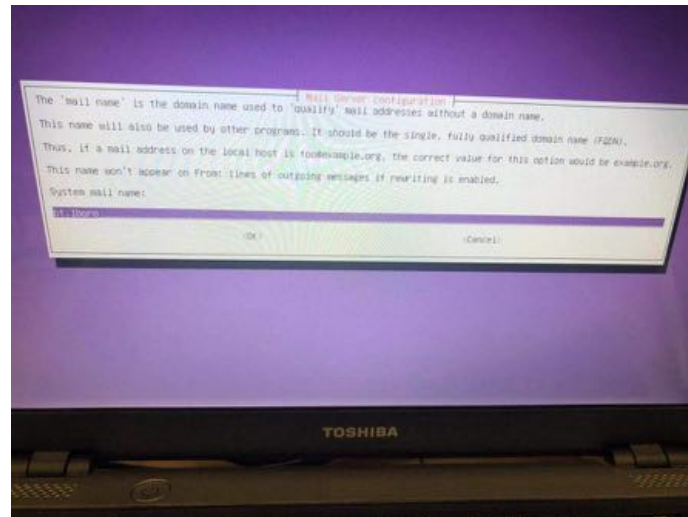

```
1 echo "mua." | sendmail -v mail@dt3.lboro
```

The mail can be seen arriving the destination in Figure 4.11.

4.4.4 Commentary

4.4.4.1 Problem: Setting Up Domain Name

At the very beginning, when we were configuring `exim4`, we just skipped the step and forgot to set up the domain name. Later, we found that the mail cannot be sent to other groups. The domain name is reset as `bt.lboro` to solve the problem.

(a) Setting Up Mail Name.

(b) Setting Up Domain Name.

Figure 4.10: Important Configuration Steps for `exim4`.

(a) SMTP Success Message Is Returned from DT Network on Laptop 3 (BT003).

(b) Email Is Received on DT Network's Side.

Figure 4.11: Email Can Be Seen Arrived on Both Sides.

Chapter 5

Discussion

5.1 Conclusions

Several conclusions can be drawn from this lab.

1. BT Network, a small Tier-2 ISP, has been built and well tested.
2. BT Network provides both intra-domain and inter-domain Internet connection to its users. It serves common Internet applications including Web, DNS and Email as well.
3. BT Network forms and implements business relationships with neighbouring ISPs.
4. Both IS-IS and BGP routing protocols can provide alternative route(s) to the destination when one of the physical links is down.

5.2 Further Work

For the future, the following improvements are being considered.

1. Implement the alternative **next-hop solution** instead of "passive interface" as in Section 3.1.5.2.
2. Fully test the implementation of BGP routing in IPv6. We are unable to test it as no neighbouring ISP has set up IPv6 BGP routing as far as we know.
3. Provide other Internet services such as Dynamic Host Configuration Protocol (DHCP)[12] and File Transfer Protocol (FTP)[13].

Chapter 6

Contributions

Our team is composed of 5 members from Loughborough University.

6.1 Group Leader: Zhihao DAI

In this lab, Zhihao DAI contributes to designing the architecture of the network, assigning IP addresses to interfaces, setting up BGP routing protocol as well as securing access to routers. Additionally, DAI is responsible for organising and formatting the whole report.

6.2 Technical Director: Yunsong ZHANG

Yunsong ZHANG contributes to designing the architecture of the network, setting up IS-IS routing protocol as well as DNS services.

6.3 Network Engineer: Huijing LEI

Huijing LEI contributes to setting up Web services. Additionally, LEI is responsible for References section in the report.

6.4 Network Engineer: Changrong CHEN

Changrong CHEN contributes to assigning IP addresses to interfaces and setting up Email services.

6.5 Network Engineer: Yan HUANG

Yan HUANG contributes to setting up Email services. Additionally, HUANG is responsible for Discussion section in the report.

Appendix A

Login Details

A.1 Laptops

```
1 Laptop 1 (BT001):  
2   Username: bt001  
3   Password: Bt9049.4581  
4  
5 Laptop 2 (BT002):  
6   Username: bt002  
7   Password: Bt8717.0801  
8  
9 Laptop 3 (BT003):  
10  Username: bt003  
11  Password: Bt6941.6657
```

A.2 Routers

Routers can be remotely accessed without entering the password using public-key authentication (root required) on Laptop 1 (BT001). The password for each router is one of $a^2+2ab+b^2$, a^2-ab+b^2 or a^2+b^2 .

```
1 Router 1 (BT-R001):  
2   Username: r001  
3  
4 Router 2 (BT-R002):  
5   Username: r002  
6  
7 Router 3 (BT-R003):  
8   Username: r003
```
